

RADIOLOGY REPORT

Department of Radiology
Medical Imaging Center

PATIENT INFORMATION

Patient Name: Jacqueline932 Carlena776 Gislason620
Patient ID: 7aa400ef-0e76-1add-91a9-26587fad2b5c
Date of Birth: 09/17/2010
Gender: female

STUDY INFORMATION

Study Date: 01/22/2023
Modality: CT
Anatomical Region: abdomen
Study UID: 1.2.840.113654.2.55.123456789012345678901234567890.3

CLINICAL INDICATION

Evaluation for suspected malignancy. Clinical correlation requested.

TECHNIQUE

Contrast-enhanced CT examination of the abdomen was performed following administration of intravenous contrast material. Multiplanar reconstructions were obtained.

FINDINGS

There is a 4.8 cm spiculated mass in the left lower lobe of the lung. The mass demonstrates irregular margins and appears to invade the adjacent pleura. Associated mediastinal lymphadenopathy is noted, with enlarged lymph nodes measuring up to 1.2 cm in the paratracheal station.

No pleural effusion is identified. The remaining lung parenchyma shows no acute abnormality. The heart size is within normal limits.

IMPRESSION:

1. Suspicious lung mass in the left lower lobe with features concerning for primary lung malignancy. Clinical correlation and tissue diagnosis recommended. 2. Mediastinal lymphadenopathy, likely representing nodal metastases.

Dr. Emily Rodriguez, MD

Board Certified Radiologist
